

Electrical cabinet lifting bars

Specifically designed and engineered for purpose is our electrical cabinet lifting bars, available in two sizes the bars when used as a pair pass through the holes in the base or frame of the cabinet providing a secure lifting point for rigging to a small spreader beam above the load.

When lifting with these bars the load is taken up without the risk of crushing the cabinet when used with a spreader beam.

The bars have tapped threads to the top faces and ends to accommodate the Townley lifting points that are removed to install the bars.

Lifting Gear Hire & Sales can provide a full rigging set-up including small modular spreader beams that can be assembled in 100mm increments plus round slings and any other rigging.
